

**Cefic Guidance on  
Safety Risk Assessment  
for Chemical Transport Operations  
JC Hermand**

# Transport Risk Assessment

---

## Background

- As part of its commitment to Responsible Care, the chemical industry strives to continuously improve its safety performance through learning from shared experience and implementing best practices.
- Increasing urbanization and higher risk aversion of society result in more and more restrictions on the transport of dangerous goods (e.g. 'Basisnet' in the Netherlands).
- Risk assessment is an important tool in risk management

*In 2012 the Cefic SIG Logistics decided to create a new Issue Team to review current transport risk assessment practices and to develop Cefic guidance on transport risks assessment*

# Transport Risk Assessment

---

➤ **Qualitative**

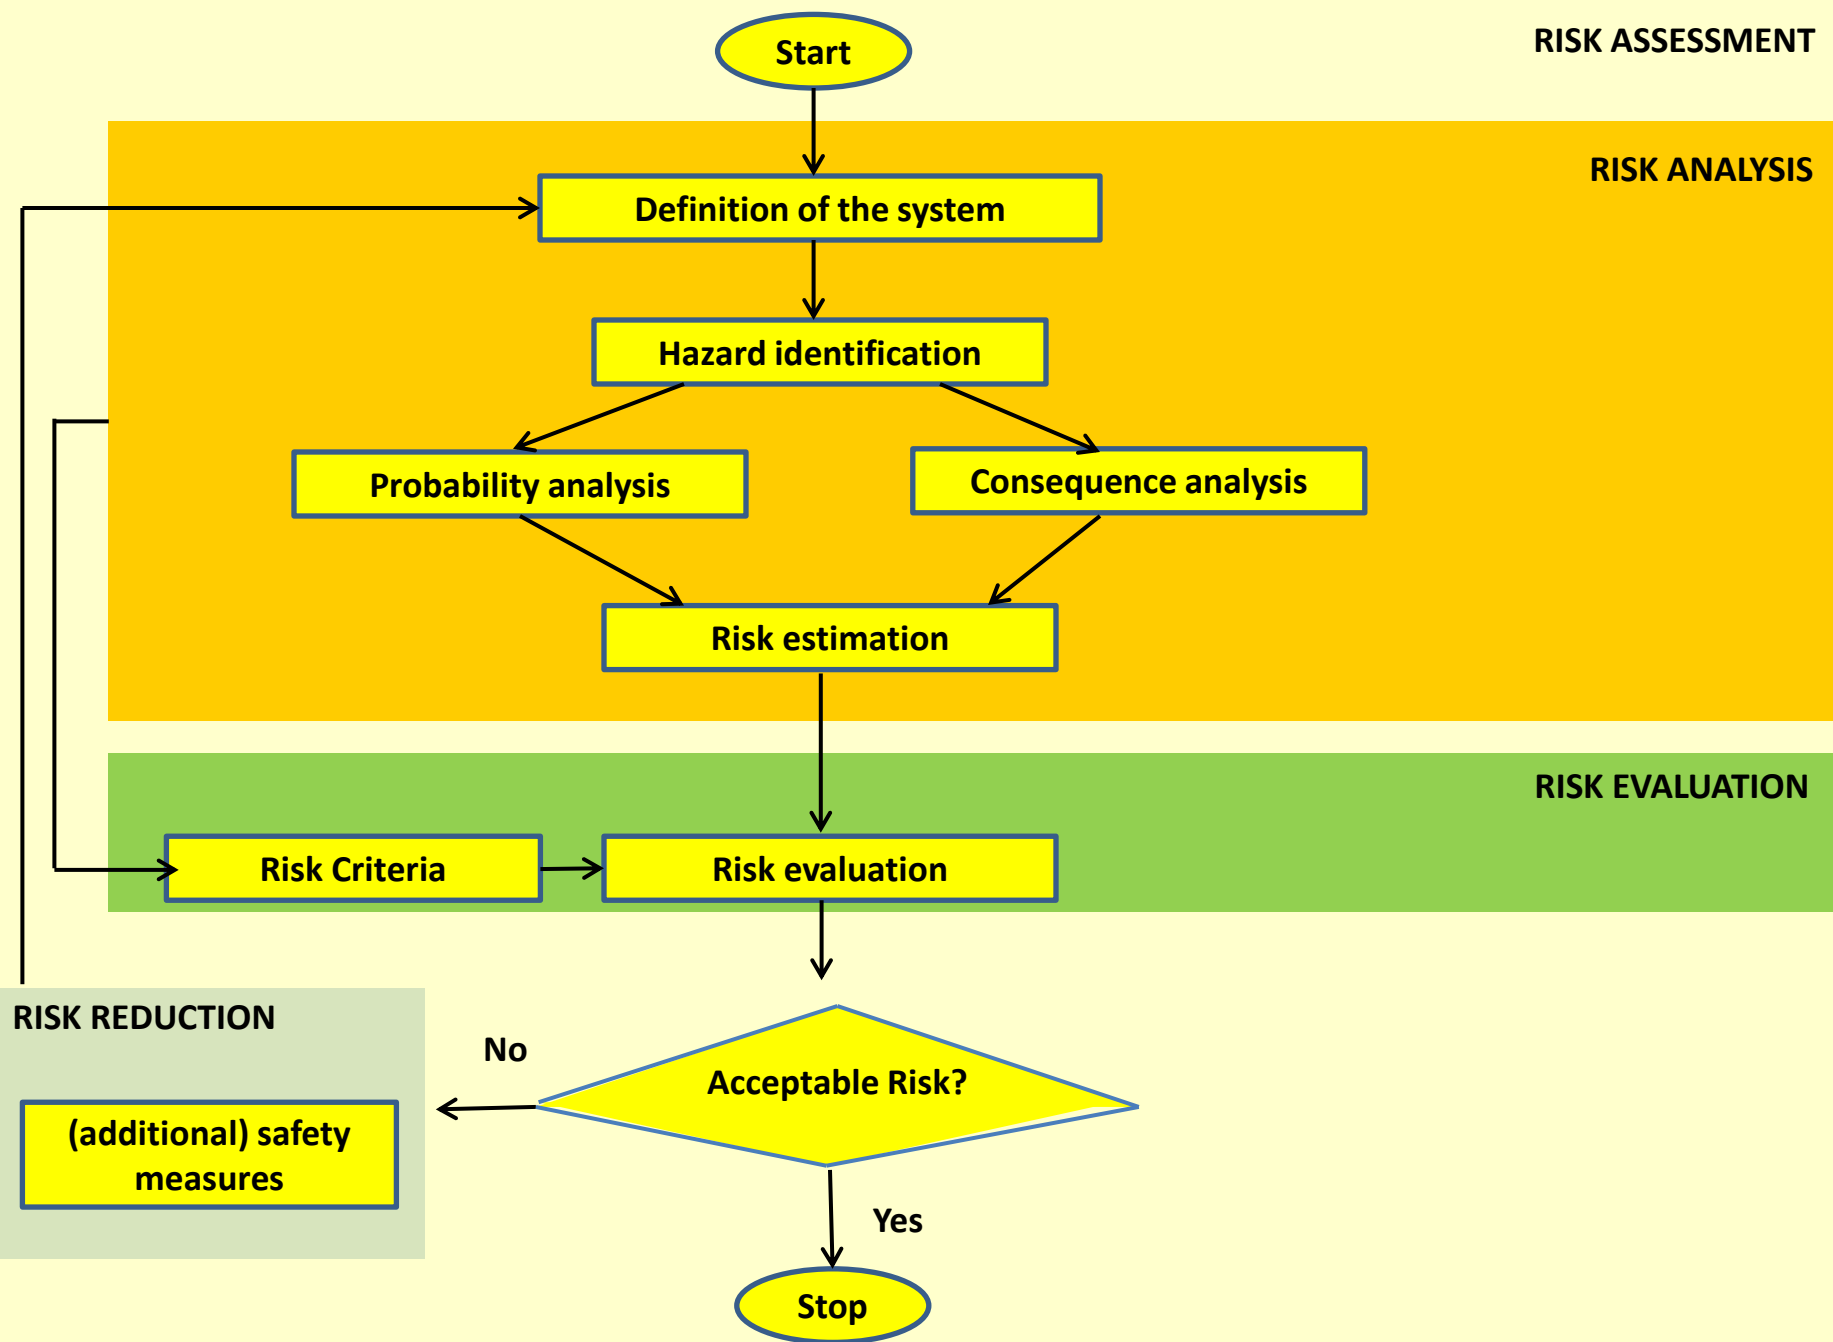

➤ **Quantitative**

# Qualitative transport risk assessment

- 
- **First step in overall risk assessment process**
  - **Results in relative ranking**
  - **Identification of higher risk operations/scenarios**
  - **No use of precise numeric values (probability)**
  - **No detailed calculations of risks**

*Same assumptions to be used throughout whole process in order to maintain consistency in the approach*

# Qualitative transport risk analysis

---

## Different steps

- **Definition of transport operation to be analysed**
- **Identification of all relevant hazards**
- **Consequence analysis**
- **Probability analysis**
- **Risk estimation (matrix)**

# Qualitative transport risk assessment

---

**Consequence analysis** = investigation of potential consequences of a transport accident taking into account the intrinsic hazards of the product (**hazard severity analysis**) and the potential exposure to these hazards (**hazard exposure analysis**)

# Hazard severity ranking

<i>Hazard severity (potential impact)</i>	<i>Criteria</i>	<i>Score (A)</i>
Low potential impact	PG III in bulk	1
Intermediate potential impact	PG II in bulk	2
High potential impact	PG I in bulk	3
Very high potential impact	<b>-Toxic by inhalation in any quantity</b> - Flammable gases in bulk - Toxic gases in bulk - Highly flammable liquids in bulk - Highly toxic liquids in bulk	4

# Hazard exposure ranking

---

<i>Population density along the transport route</i>	<i>Proximity of environmentally sensitive areas *</i>	<i>Score (B)</i>
<b>Low</b>	<b>Very distant</b>	<b>1</b>
<b>Intermediate</b>	<b>Distant</b>	<b>2</b>
<b>High</b>	<b>Close</b>	<b>3</b>
<b>Very high</b>	<b>Very close</b>	<b>4</b>

# Total consequence ranking

<b>Hazard Severity Ranking Score (A)</b>	<b>Hazard Exposure Ranking Score (B)</b>			
	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>
<b>4</b>	<b>16 (IV)</b>	<b>12 (IV)</b>	<b>8 (III)</b>	<b>4 (III)</b>
<b>3</b>	<b>12 (IV)</b>	<b>9 (III)</b>	<b>6 (III)</b>	<b>3 (II)</b>
<b>2</b>	<b>8 (III)</b>	<b>6 (III)</b>	<b>4 (III)</b>	<b>2 (II)</b>
<b>1</b>	<b>4 (III)</b>	<b>3 (II)</b>	<b>2 (II)</b>	<b>1 (I)</b>

<b>Total Consequence Ranking</b>	<b>Total score</b>
<b>Very high consequence (IV)</b>	<b>16/12</b>
<b>High consequence (III)</b>	<b>9/8/6/4</b>
<b>Moderate consequence (II)</b>	<b>3/2</b>
<b>Low consequence (I)</b>	<b>1</b>

# Probability analysis

---

**Probability of occurrence of a transport hazard determined by**

- **accident frequencies for the transport mode being assessed**
- **transport volumes and distances**

**Data on transport accident frequencies are not readily available, in particular data on frequencies of accidents with loss of containment**

**Transport accident frequencies are normally expressed as number of accidents per distance driven by the transport vehicle (truck, train, barge).**

# Probability analysis

## Overview of accident frequencies based on accident data of 1994-1996 \*

(see Guidelines for quantitative risk assessment. "Purple Book". Report CPR 18E.)

\* *More country/product/mode specific accident frequencies can be found in literature.*

<b>ROAD</b> Average	$1.8 \times 10^{-7}$ /truck.km
<b>RAIL</b> Average Speed >40 km/h Speed <40 km/h	$3.6 \times 10^{-8}$ /car.km $4.5 \times 10^{-8}$ /car.km $2.2 \times 10^{-8}$ /car.km
<b>BARGE</b> Navigability Class (CEMT) 4 Navigability Class (CEMT) 5 Navigability Class (CEMT) 6	$6.7 \times 10^{-7}$ /vessel.km $7.5 \times 10^{-7}$ /vessel.km $1.4 \times 10^{-6}$ /vessel.km

# Example of a risk matrix

Total consequence Ranking Hazard x Exposure	Probability			
	Very unlikely	Not likely	Likely	Frequent
Very high consequences (IV)	Yellow	Red	Red	Red
High consequences (III)	Blue	Yellow	Red	Red
Moderate consequences (II)	Green	Blue	Yellow	Yellow
Low consequences (I)	Green	Green	Blue	Yellow

## Risk Category

4	Very high risk
3	High risk
2	Moderate risk
1	Low risk

# Quantitative transport risk assessment

---

*Based on many assumptions: uncertainty of available accident frequency data*

- **To be used primarily for transport operations with very high consequence ranking**
- **Only to be used for relative ranking of different transport options**
- **Calculation of absolute risk levels often not meaningful**

# Risk mitigation

Total consequence Ranking	Probability			
	Very unlikely	Not likely	Likely	Frequent
<i>Hazard x Exposure</i>				
Very high consequences (IV)	←	↓		
High consequences (III)		←	↓	
Moderate consequences (II)				
Low consequences (I)				

- Reduction of probability of accidents
- Reduction of probability of leakage in case of an accident
- Reduction of potential consequences

# Risk mitigation measures

---

## Reduce the probability of an accident by

- reducing the total volume of transported product
- reducing the distance
- selection of the mode of transport
- selection of the route of transport
- selection of the carrier (using SQAS etc)
- training of all people involved in the transportation process (drivers, managers, planners,...)
- maintenance and inspection of the transport equipment
- systems increasing the stability of the vehicle
- taking into account weather conditions
- taking measures to improve security

# Risk mitigation measures

---

## Reduce the probability of leakage in case of an accident by

- Reducing the speed of the vehicle
- Improving the quality of the containment (e.g. shell thickness of tanks, double shell, ...)
- Installing crash-buffers (on rail tank cars)

# Risk mitigation measures

---

## Reduction of potential consequences

### Hazard severity

Since in most cases the hazards are intrinsic to the product to be transported, there is little opportunity to reduce these (change concentration / phase)

Reduction of the size of the containment (packed instead of bulk, compartmentization of tank)

### Hazard exposure

Reduce potential exposure along the transport route by changing the

- transport mode
- transport route (e.g. rail route, motorways vs secondary roads; roads avoiding densely populated urban areas)
- time of transport (day vs night).

# Viarregio – LPG rail accident

	<b>VIARREGIO    LPG</b>
<b>Hazard Classification</b>  <b>HIN</b>	<b>UN 1075</b> <b>Class 2/ flammable gas</b> <b>HIN 23</b>
<b>Containment</b>	<b>Bulk</b>
<b>Hazard severity ranking</b> <b>Fig 2</b>	<b>Very high potential risk</b> <b>A = 4</b>
<b>Hazard exposure ranking</b> <b>Fig 3</b>	<b>Population density : high/very high</b> <b>B = 3/4</b>
<b>Total consequence ranking</b> <b>Fig 4</b>	<b>A x B = 12-16 (IV)</b> <b>Very high consequence</b>
<b>Probability</b>	<b>4.5 x very unlikely</b>
<b>Risk category</b>	<b>Yellow (3)</b> <b>High risk</b>

# Risk matrix Viarregio

Total consequence Ranking	Probability			
	Very unlikely	Not likely	Likely	Frequent
<b>Hazard x Exposure</b>				
Very high consequences (IV)	Viarregio			
High consequences (III)				
Moderate consequences (II)				
Low consequences (I)				

# Waldhof - barge sulphuric acid

	<b>WALDHOF Sulphuric Acid</b>
<b>Hazard Class</b> <b>HIN</b>	UN 1830 Class 8 /Corrosive liquid – PG II HIN 80
<b>Containment</b>	Bulk
<b>Hazard severity ranking</b> <b>Fig 2</b>	Intermediate potential risk A = 2
<b>Hazard exposure ranking</b> <b>Fig 3</b>	Proximity of water course: very close B = 4
<b>Total consequence ranking</b> <b>Fig 4</b>	A x B = 8 (III) High consequence
<b>Probability</b>	$1.4 \times 10^{-6}$ (not likely)
<b>Risk category</b>	Yellow (3) High risk

# Risk matrix Waldhof

Total consequence Ranking	Probability			
	Very unlikely	Not likely	Likely	Frequent
<b>Hazard x Exposure</b>				
<b>Very high consequences (IV)</b>				
<b>High consequences (III)</b>		<b>Waldhof</b>		
<b>Moderate consequences (II)</b>				
<b>Low consequences (I)</b>				

Risk Category

4	Very high risk
3	High risk
2	Moderate risk
1	Low risk

# Antwerp – road bromine accident

	<b>ANTWERP bromine</b>
<b>Hazard Class</b> <b>HIN</b>	UN1744 Class 8/Corrosive liquid, toxic – PG I HIN 886
<b>Containment</b>	Bulk
<b>Hazard severity ranking</b> <b>Fig 2</b>	Very high potential risk A = 4
<b>Hazard exposure ranking</b> <b>Fig 3</b>	Population density: high B = 3
<b>Total consequence ranking</b> <b>Fig 4</b>	A x B = 12 (IV) Very high consequence
<b>Probability</b>	$1.8 \times 10^{-7}$ (not likely)
<b>Risk category</b>	Red (4) Very high risk

# Risk matrix bromine

Total consequence Ranking	Probability			
	Very unlikely	Not likely	Likely	Frequent
<b>Hazard x Exposure</b>				
Very high consequences (IV)	Yellow	Antwerp Bromine (Red)	Red	Red
High consequences (III)	Blue	Yellow	Red	Red
Moderate consequences (II)	Green	Blue	Yellow	Yellow
Low consequences (I)	Green	Green	Blue	Yellow

# Potential risk reduction measures

<b>Risk Reduction Measures</b>	<b>Rail</b> <b>VIARREGIO</b> <b>LPG</b>	<b>Barge</b> <b>WALDHOF</b> <b>Sulphuric acid</b>	<b>Road</b> <b>ANTWERP</b> <b>Bromine</b>
<b>Reduce hazard exposure level</b>	<ul style="list-style-type: none"> <li>- Change rail route to avoid populated areas</li> <li>- Change transport mode to avoid populated areas (to barge/road/ pipeline) ???</li> </ul>	<ul style="list-style-type: none"> <li>- Change transport mode (to road or rail)???</li> </ul>	<ul style="list-style-type: none"> <li>- Change route in port of Antwerp ?</li> <li>- Change transport mode ???</li> </ul>
<b>Reduce probability of occurrence</b>	<ul style="list-style-type: none"> <li>- Better inspection &amp; maintenance of equipment</li> <li>- Lower speed of train</li> <li>- Remove sharp objects along the rail track</li> <li>- Install crash buffers</li> <li>- Use tank cars with higher shell thickness</li> <li>- DDD</li> </ul>	<ul style="list-style-type: none"> <li>- Increase stability of ship</li> <li>- Better management of ballast water</li> <li>- Improve training of ship crew</li> <li>- Improve ship vetting system</li> </ul>	<ul style="list-style-type: none"> <li>- Increase stability of truck by lowering chassis and gravity point</li> <li>- Improve selection of transport company (dedicated haulier)</li> <li>- Improve experience and training of drivers (awareness of high density of product)</li> </ul>

# Accident scenarios with potential high consequences

---

- **UVCE (Unconfined Vapor Cloud Explosion)**
- **Hot BLEVE (Boiling Liquid Expanding Vapour Explosion)**
- **Toxic vapor cloud release**
- **Pool fire**
- **Jet fire**
- **Spillage of substances harmful for the environment**
